Hello everybody

In the following topic I read several topics related to the GF-21 and GF-22 devices.
I just joined Traccar and made the following adjustment to the GF-22 to give it access to the Traccar server:
domain#45.55.84.20#5010#
The device accepted the command with the response: "Domain set success"
But on the Traccar platform it appears turned off.
Could anyone help me identify what could be wrong?
PS: Regarding the protocol, I haven't explored the case yet, for now I want to see the device connected.
Thanks!

As current information:
I changed the SIM card to another regional operator (Brazil) and now the GF-22 is connected and sending the coordinates correctly.
The protocol is trv.
Now I need to study the documentation and see if I can share the data with my server.

Hello. Witch operator did you use in Brazil? I'm trying using VIVO SIM card but I can't receive sms from this SIM card.

TRACCAR

Traccar is a free and open source modern GPS tracking system.
